Modulators of the intracellular signalling molecules of the invention exhibit immunosuppressive; cytostatic; neuroprotective; notropic; antiarteriosclerotic; antialialmanatory; anti-HIV; neuropecterial; antifungal; antiviral; antiparasitic; neuroleptic; antiapecterial; antifungal; antiviral; antiparasitic; antihelminthic; and antiparkinsonian activity. INTRA polypeptides their agonists and antiparkinsonian activity. INTRA polypeptides their associated with decreased or increased expression of functional INTRA. Disorders associated with abnormal INTRA expression or activity include cell proliferative disorders e.g. arteriosclerosis and cancers; autoimmune or inflammatory disorders e.g. arteriosclerosis and cancers; cutoimmunodeficiancy syndrome (AIDS); viral, bacterial, fungal, parasitic, protozoal and helminthic infections; gastrointestinal disorders e.g. cysphagia and irritable bowel syndrome; neurological disorders e.g. cysphagia and irritable bowel syndrome; neurological disorders e.g. cysphagia and irritable bowel syndrome; neurological disorders e.g. cysphagia and isorders e.g. antipological disorders e.g. cysphagia and isorders e.g. antipological disorders e.g. diseases and mental disorders e.g. antipological in the diagnosis of the above disorders.
                                                                                                                                                                                                                                                              for the diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    121

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Discorders which are diagnosed or treated include autoinguine diseases e.g. rheumatoid arthritis, hyperproliferative discorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacterial viruses c.g. Acquired immunodeficiency virus (AIDS) and fundi, ocular disorders e.g. cerebral infection, gastrointestinal disorders e.g. dysphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pitultary dwarfism, cancers and disorders at the cellular level e.g. leuwaemia, disorders involving neovascularisation e.g. manignancies, respiratory disorders e.g. nonallergic rhinits, renal disorders e.g. caute kidney failure and blood related disorders e.g. myocardial conference in farction. The polypeptides can also be used to aid wound healing and ceptibal cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotraxis. The conference of increase or decrease storage capabilities, fat content, lipid, protein,

polynucleotides (II). (I), (II) and the antibody to (I) are useful for diagnosting, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. theumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C). bleeding disorders, haemoglobin abnormalities and other blood related disorders (sickle cell anaemia), myeloproliferative disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. disorher's disease and cancer), neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease), chromosomal abnormalities (bown syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. g. domerulonephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders in wound healing, epithelial cell proliferation, endocrine disorders (inflammatory disorders), liver disorders (critosis), as stimulators of B-cell responsiveness to pathogens, activators of T-cells, to induce higher affinity antibodies, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AIDS). ANU17089 appresent novel signal transduction and an approach of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     915

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (I), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               as

                                                                                                                                                                                                                 The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           265

The invention describes an isolated nucleic acid molecule (I) encoding a novel central nervous system protein. (I) and polypeptides (III) encoded by (II), are used to treat a medical conditions and in diagnosis of a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative clisorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiovascular disorders e.g. anglogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses e.g. Acquired immunodeficiency virus (AIDS) and fungi, ocular disorders e.g. corneal infection, gastrointestinal disorders e.g. dysphagia, denocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes can dipituitary dwarfism, cancers and disorders at the cellular level e.g. leukaemia, disorders e.g. malignancies, respiratory disorders e.g. malignancies, respiratory disorders e.g. malignancies, respiratory disorders e.g. monallergic rhinitis, renal disorders e.g. caute kidney failure and blood related disorders e.g. mycorafial cinfarction. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and oil chemotaxis. The collen, protein, increase or decrease storage capabilities, fat content, lipid, protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid encoding a protein for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length:

parinological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerebral ischaemia, c.g. e.g. cardidac arrest, cerebrovascular disorders e.g. cerebral ischaemia, c.g. angiogenesis, nervous system disorders e.g. Alzheimer's disease and amylotrophic lateral sclerosis, infections caused by bacteria, viruses c.g. arguired immunodeficiency virus (AIDS) and fundi, coular disorders c.g. e.g. Acquired immunodeficiency virus (AIDS) and fundi, coular disorders c.g. daphagia, adenocarcinomas and irritable bowel syndrome, reproductive system disorders e.g. testicular feminisation, endocrine disorders e.g. diabetes and pituitary dwarfism, cancers and disorders e.g. malignancies, cleukaemia, disorders e.g. nonallergic rhinitis, renal disorders e.g. respiratory disorders e.g. nonallergic rhinitis, renal disorders e.g. cette kinney failure and blood related disorders e.g. myocardial cinfarction. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to ce epithelial organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The minary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antinflammatory; anti-HIV; antibacterial; antiinflammatory; cancer; immune system disorder; rheumatoid arthritis; inflammatory condition; organ transplant rejection; infection; hepatitis C; blood disorder; sickle cell anaemia; hyperproliferative disorder; Gaucher's disease; neurodegenerative disorder; Alzheimer's disease; parkinson's disease; chromosomal abnormality; Down syndrome; ischaemia; renal disorder; cardlovascular; respiratory; wound healing; endocrine; Addison's disease;

The invention relates to novel isolated polypeptides (I), and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune clasorders (e.g. congenital and acquired immunodeficiencies, autoimmune clasorders (e.g. theumatoid arthritis), inflammatory conditions, organ trapsplant respections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and other blood-related disorders (sickle cell anaemia), myeloproliferative disorders, primary haematopoietic disorders, hyperproliferative disorders (e.g. Gaucher's disease, Parkinson's disease), chromosomal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal abnormalities (Down syndrome), ischaemic injury (e.g. stroke), renal disorders (e.g. glomerulonephritis), cardiovascular disorders (e.g. disease), reproductive system disorders (antibamatory disorders), liver disorders (antibammatory disorders), liver disorders (clirhosis), as stimulators of B-cell responsiveness to pathogens, activators of as stimulators of higher affinity antibodies, and as a means to induce tumour proliferation in pathologies e.g. acquired immune deficiency cyndrome (AIDS). AAU17059-AAU17683 represent novel signal transduction as well as a means to induce the approach of the invention.
                                                                                                                                                                                                                          Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been sizolated and nucleotide sequences of 5'- and 3'-ends of the CDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA asily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      315

The invention relates to mover number section bodyperides are also and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptides and cells genetically the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopolesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU25510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ucleic acids encoding a range of human polypeptides, useful in genetic accination, testing and therapy {\ \ }

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and cancer antigens. The colon cancer antigens have cytostatic activity and cancer in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. Colorectal cards into a host cell and culturing the nucleic acids into a host cell and culturing the cell of the expression of the cand ABH377804 and treatment of colorectal carcinomas and cancers. 	SULT 13 -09-289 Sequence Patent	i-578-9 e 9, Application US/09289578 No. 6428978
	GENERAL INFO APPLICANT: APPLICANT: APPLICANT:	INFORMATION: ANT: Olsen, David R ANT: Chang, Robert ANT: McMullin, Hush

```
APPLICANT: Hitzeman, Ronald A.

APPLICANT: Chisholm, George
TITLE OF INVENTION: NOVEL METHODS FOR THE PRODUCTION OF GELATIN AND
TITLE OF INVENTION: EULL-LENGTH TRIPLE HELICAL COLLAGEN IN RECOMBINANT
TITLE OF INVENTION: CELLS
FILE REFERENCE: 225002034400
FURRENT FAPLICATION NUMBER: US/09/289,578
CURRENT APPLICATION NUMBER: 06/084,828
PRIOR APPLICATION NUMBER: 60/084,828
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              565
